SUPERNOVA REMNANTS AND GAMMA-RAY SOURCES

Diego F. Torres, Gustavo E. Romero, Thomas Dame, Jorge Combi and Yousaf Butt

This contribution partially presents the results of a review on the possible relationship between gamma-ray sources and SNRs (Torres et al. Physics Reports, to appear). We identify and analyze each positional coincidence between SNRs and 3EG gamma-ray sources, and evaluate the different scenarios that might give rise to a physical association. The variability status of the gamma-ray sources involved, the possibility of them being produced by known radio pulsars, as well as new CO (J=1-0) maps are presented.
